

## How to describe an early warning system?

Early warning system is a broad term for all the systems, actions and programs that aim to identify early distress signals and provide timely intervention to tackle early leaving from education.

The Thematic Working Group on Early School Leaving of the European Commission was responsible for policy level improvement based on the studies of member states' practice and policy regarding this issue, between 2011-2013. The working group, built up from the governmental and non-governmental experts of member states, conducted surveys on current practices and collected information on the states. It concluded there is no such a country with a perfectly complex early warning system and there are remarkable differences in the aspects which considered the most important in each country. Furthermore systems are different in terms of organization of early warning system: it can be part of the mainstream education system or a separate area dedicated only for this issue. For the majority of the countries it is part of the mainstream.

### Why is it important to build up such a system?

In the first place, a protocol based system has less room for subjective, random actions in case of a problem that can be well defined. We already have such examples in THE European systems such as the very general absenteeism and its strict follow up by any countries. It provides a frame for all those working in the system while narrowing the risk of a young person being unseen and unsupported with their problem.

## Resource Pool EN

### #1

The people working day by day on the field are probably the wisest about which student has to be supported only after some weeks of observation already. The risk of leaving school early has widespread early signals which are many times seen common by different experts and countries.

For instance the already mentioned absenteeism, especially unnoticed one is considered as one of the most important early distress signal of a dropout so that it has a close follow up and well administered system all over. Nevertheless there are signals lacking a school protocol, being important factors though. One of these signals is boredom or loss of motivation during the classes for example. Special targeted programs and system level follow up in case of these less commonly registered signals contribute to a more efficient system in lowering the number of dropout students, proved by the examples of countries tackling dropout more successfully.

Another reason for building up an early warning system is the well-defined role of teachers and other actors outside of school in the process. This means the teacher is not alone in tackling dropout and has the possibility to cooperate with other professionals with other competence.

### How to build the early warning system?

Traditionally there are three levels the different programs can work on: prevention, intervention and correction. Early warning system is initially more about intervention to tackle the problem when its

first signals appear. Timely intervention is very effective in any sense from financial to efficiency: students remain in school with a much higher possibility if they can get support at the beginning, and they finish and go to the labour market earlier which is useful for the economy, besides teachers and other professionals have an easier job when the problem has just occurred.

The below list shows the most important policies and measures on each level of acting identified in different countries in Europe:

#### On Prevention level

- Improving access to and quality of ECEC (early childhood education and care)
- Reducing grade retention
- Desegregation policies
- Positive discrimination measures
- Developing extra-curricular activities
- Increasing flexibility and permeability of educational pathways
- Inclusion of ELET in initial teacher education and professional training
- Education and career guidance

#### On Intervention level

- Providing individual support
- Support for low achievers
- Language support for students with a different mother tongue
- Specialist staff supporting teachers and students
- Identification of groups at risk of ELET
- Developing early warning systems for students at risk of ELET
- Absenteeism management
- Networking with parents and other actors outside school

#### On Compensation level

- Reform of the second chance education system
- Identification of early leavers and measures to help them re-enter education and training (Eurydice-CEDEFOP 2014 57.)

### **Institutional level EWS**

A well-functioning and logically structured EWS has its data gathering and measurement and monitoring-evaluation elements. As an input the circumstances e.g. social status of the student is important information: his or her knowledge, interests, skills and personality besides family circumstances are all features that have to be considered by the school. During the process gathered data and information is used for an individual level support and teaching process. Data gathering and especially the access and usage are always a sensitive issue and still in debate, however there is a common understanding of the importance of these factors in the student being at risk. Besides input data, the monitoring and handling of everyday behaviour issues and other signals of the student are the most important elements of such a system. Beyond the trivial signals like absenteeism, deteriorating achievement or grade repetition there are several other behaviour signals that worth to be followed up by the teacher. The most common signals from these kinds are boredom or low motivation, bullying or being bullied and a sudden change in behaviour which can be an unexpected aggression or too silent reaction as well. (The listed are described in other articles where you can find more literature about each too.) An efficient EWS gives a feedback to itself about its operation: professionals working in the system are informed from time to time about the exact numbers and other efficiency indicators they developed so that they have the opportunity to improve the system based on the experiences.

An institutional EWS works on different levels: a strategy represents the whole approach of the institution, data gathering and measurement tools and processes concerning early warning signals support the system, on the other hand it works on group level meaning different students and teachers, using for instance career orientation technics, and last but not least it has a role on the level of individuals. On the level of the school actual planning is crucial besides school teams have to be formulated, with their own clear responsibilities. On the level of the individual different elements of the support system are used such as individual development plan, or the involvement of external experts. Behind a successful institutional practice there must be always an engaged leader.

The base of an EWS is always individual attention for all the students. Teachers are in the frontline with the opportunity to realize these early distress signals and ask for a proper support if it's over their competence. Early leaving from education and training as an issue has to be built into teacher initial training and further education while the cooperation with other sectors has to be improved too. Tackling dropout is a shared responsibility of all connecting actors.

### **The role of the school and the teacher**

According to European data the quality of the school seems to be indicative considering the perspectives of its students. "Going to a predominantly low SES (socio-economic status) school will depress students' average scores, while going to a high SES school will tend to raise them. The effect is that a young person – with the same mix of dis/advantages and the same history of school achievement– will leave one school early but would not leave another school early. On the other hand students with objectively almost the same characteristics and in same situation schools perform differently: this shows the own effect of the specific school itself. This effect is widely noted and recognised. It is statistically significant in every country in PISA."

The significant role of school environment and student-teacher relationship is strengthened by an American study as well. It quotes results about Chicago Public Schools indicate that students' course performance is related to three school factors: relationships with teachers, the relevance of classroom instruction to their perceived future, and teachers' cooperation with each other. Data even proves that high level of trust and personal support decrease failures while unsuccessful students hardly see teachers as helpful and motivating actors. Just as in family so in school expectations and requirements have a great effect on final attainment.

Based on another US study the characteristics of schools that have been unsuccessful with holding onto their at-risk youth include the following: "low expectations for success, inconsistent discipline, low teacher involvement and/or accountability, inattention to individual student needs, and a low level of engagement in productive learning activities". As opposed to this, the characteristics of successful dropout reduction programs include strong commitment by instructional staff, quality leadership, small class size, and fair and consistent discipline that is clearly communicated. Furthermore these schools have a curriculum expanded to include personal and career components; teachers/administrators who believe the students can succeed; students who participate in the programs by their own choice; the wide availability of support services; a high amount of personalized interactions among staff and students; learning that is emphasized over teaching; and funding that is available for smaller class sizes and more equipment and resources.

About the role of the teachers there are many studies from the US, Australia and Quebec. Hattie's research was aiming at identifying the features of excellent teachers as he identified teachers as the second most important influence on student's achievement after the students themselves.

Percentage of Achievement Variance

Forrás: Hattie, J. 2003 3.

Beyond excellence the attitude towards students is as well important in the learning process. According to a Quebec research the more at-risk are the students the less positive are the attitudes towards them. Interestingly, teachers have different attitude towards students who fail from different reasons, proved by another USA research. Those who fail due to perceived lack of effort are in a better position than those who fail due to perceived lack of ability or other mitigating circumstances. Other researchers, as well from Quebec highlighted one important conclusion that depressive type students are not so much in the focus of teachers so that they are probably unseen by them as they normally cause no "problem" meaning behaviour issues in the classroom.

### Features lead to school dropout

| School Factors  | Curriculum Factors  | Family factors  | Individual Factors   |
|---|---|---|--|
| Teachers lack skills to work with disengaged students | Perceived irrelevance of curriculum                                       | Education not valued – limited support to remain in school            | Issues with self-esteem, confidence, social skills, coping skills and resilience   |
| Lack of training opportunities for teachers           | Prescribed academic curriculum  | Absence condoned by parents   | Negative experience of school including discrimination, academic failure and transfers to lower level of education   |
| Lack of educational resources and support staff       | Lock in to inappropriate vocational/academic courses                      | Household problems, processes and dynamics                            | Relationships with peers: <ul style="list-style-type: none"> <li>• Outsider/loner/bullying</li> <li>• Friends beyond school attracting out of school</li> <li>• Alpha female/male – high degree of autonomy, behaviour problems and actively influencing others' disengagement</li> <li>• Colluder/disputant – non-attendance influenced by truanting peers</li> </ul> |
| School admission policies                             | Reduction in pastoral time as a result of curriculum pressure             | Contradictory social, behavioural and cultural expectations           |  |
| Lack of supportive pastoral systems                   | Inappropriate pedagogy – focus on curriculum content rather than learners | Expectations of assumption of adult roles and caring responsibilities |  |
| Insufficient career advice and guidance               | Incompatible learner and school norms                                     |   |  |
| Teacher/pupil relationships                           | Lack of alternative education provision with formalised accreditation     |   | Lack of academic ability, special educational needs and difficulties in coping with traditional assessment procedures  |
| Low status of vocational education                    |   |   | Boredom, alienation, discouragement, Health problems including mental, health problems leading to absence and substance misuse   |
